

AD savePicture

«interface»
PictureProperties

type: string
positionX: number
positionY: number
velocityX: number
velocityY: number
size: number

look for HTML Element "Datalist" and save found pictures names in seperate function through the response.text()

let entry of response

so that everything that is being received is sorted

now only Objects that should be pushed onto the canvas are left

let objectProperties: string [] = []

only the needed information
